1 General

fx-project Open Source, Version 24, as of October 2024

1.1 Brief description

This tutorial explains step-by-step how to update an already installed version of fx-project Open Source to a newer version.

Unless otherwise described, instructions always refer to the Ultimate version of fx-project Open Source, as it includes all functionalities.

2 fx-project Open Source - Software Updates

2.1 Note

There are three ways to perform an update:

➤ Update on a local server

If you use fx-project Open Source on a local server or in a separately set up virtual environment (e.g. VMware) and do not want to or cannot use the latest version for VMware provided by FeRox Management Consulting GmbH & Co. KG.

Notice:

Please check if the new fx-project Open Source version requires a new PHP version before updating on a local server!

If YES, the required PHP version must be installed first (see documentation "fx-project 03.1 - Script Language PHP").

➤ Update to a new VMware version

If you want to use fx-project Open Source in the latest version provided by FeRox Management Consulting GmbH & Co. KG for the VMware and only either the previous or the new VMware version should be active alone.

➤ Migration between two VMware versions

If you want to use fx-project Open Source in the latest version for VMware provided by FeRox Management Consulting GmbH & Co. KG and have the possibility to run both the previous and the new VMware version in parallel.

2.2 Update on a local server

2.2.1 Preparations: Stop server / backups

- Make sure that no user is working with fx-project Open Source anymore.
- If possible, stop the web server, e.g. under Linux as root with:

service apache2 stop

or e.g. under Windows by clicking on the Apache icon:

- Shrink and backup your current database.

PostgreSQL, e.g. using **pg_dump**

reindexdb -U postgres -F -q -a

vacuumdb -U postgres -z -a

pg_dump -U postgres -F c -x -f /act/_backups/fxp.dmp fxp

with: **postgres** = database superuser
/act/_backups/fxp.dmp = backup file
fxp = current fx-project Open Source database

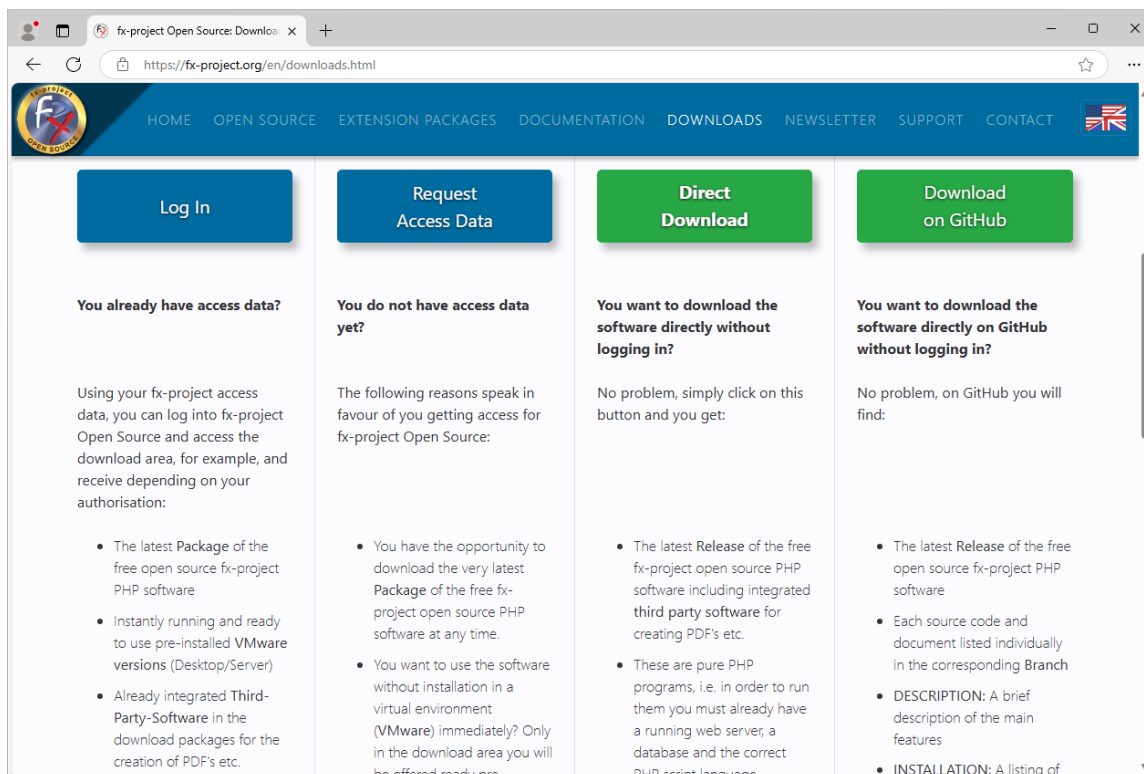

Microsoft's SQL Server, e.g. using **SQL Server Management Studio**

- Rename the current fx-project Open Source directory, here e.g. to **/act/web/fxp-21.2** (21.2 corresponds e.g. to the version of fx-project Open Source currently installed at your site)
- Create a new directory with the old name of your fx-project Open Source directory, here e.g. **/act/web/fxp**

2.2.2 Download

On our website <https://www.fx-project.org> you can find the latest software version of fx-project Open Source including extension packages, documentation and patches in the [Downloads] section.

(Illustration 1: The screenshot may differ depending on the version)

Notice:

To access the download area of fx-project Open Source you need valid access data. If you do not have any access data yet, you can request new access data.

After logging in, you will see a listing of all available downloads.

Download the latest program version (**Software**) and unpack the file into the empty fx-project Open Source directory created before (here e.g. : [/act/web/fxp](#)), which you can access from your web server.

The screenshot shows the 'Downloads' page of the fx-project Open Source website. The main heading is 'fx-project Open Source V24.1 (PHP 8.3)'. Below it, the section 'Download and Installation variant 1' is displayed. It includes instructions on how to install and configure the software on a server, mentioning that it's a pure PHP program requiring a web server, database, and PHP script language. A caution note states: 'CAUTION! For administrators or experienced users only!'. A table lists the 'Software' download, showing the date as 10/24/2024 and the file size as 58.69 MB. Below the table, there's a note about unpacking the ZIP file and reading the supplied text files ('README.txt', 'DOC/README.txt', and 'SPP/README.txt') for installation instructions.

Software	Latest PHP program version of fx-project Open Source
Date / Filesize	10/24/2024 / 58.69 MB

(Illustration 2: The screenshot may differ depending on the version)

If you have purchased **Extension Packages**, you can download the file and unpack it into your fx-project Open Source directory (here e.g.: [/act/web/fxp](#)).
➔ Overwrite any files that may already exist when unpacking.

The screenshot shows the 'Downloads' page of the fx-project Open Source website, specifically the 'Download Extension Packages' section. It includes instructions on how to extend the fx-project Open Source version with purchased packages. A note states: 'NOTE! Only usable with valid registration key(s)!'. A table lists the 'Extension Packages' download, showing the date as 10/24/2024 and the file size as 17.69 MB. Below the table, there's a note about unpacking the ZIP file into the fx-project Open Source web directory, copying or overwriting the programs in the 'SPP' subfolder, and calling the key program 'SPP/key.php' in the browser to activate the extension packages.

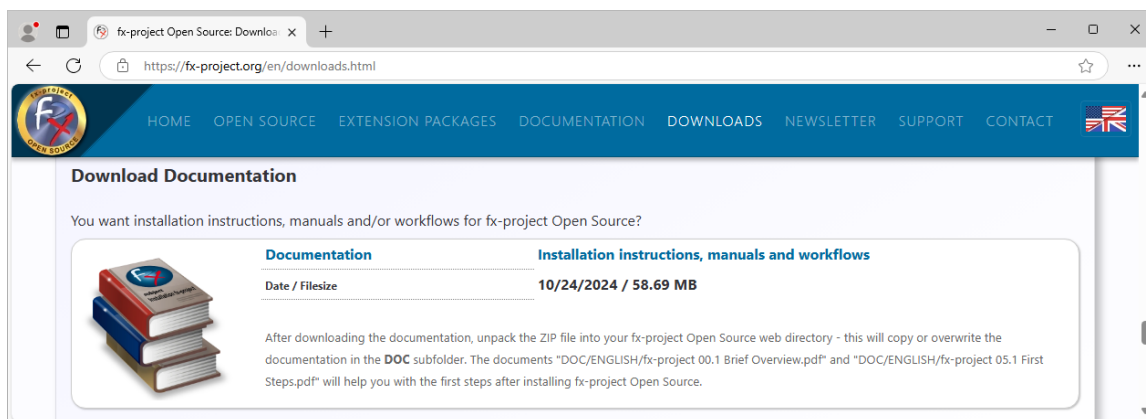

Extension Packages	Latest PHP extension packages for fx-project Open Source
Date / Filesize	10/24/2024 / 17.69 MB
Encoding	ionCube PHP 8.3+ encoded

(Illustration 3: The screenshot may differ depending on the version)

If you need extensive **Documentation**, you can download the file and unpack it into your fx-project Open Source directory (here e.g.: </act/web/fxp>).

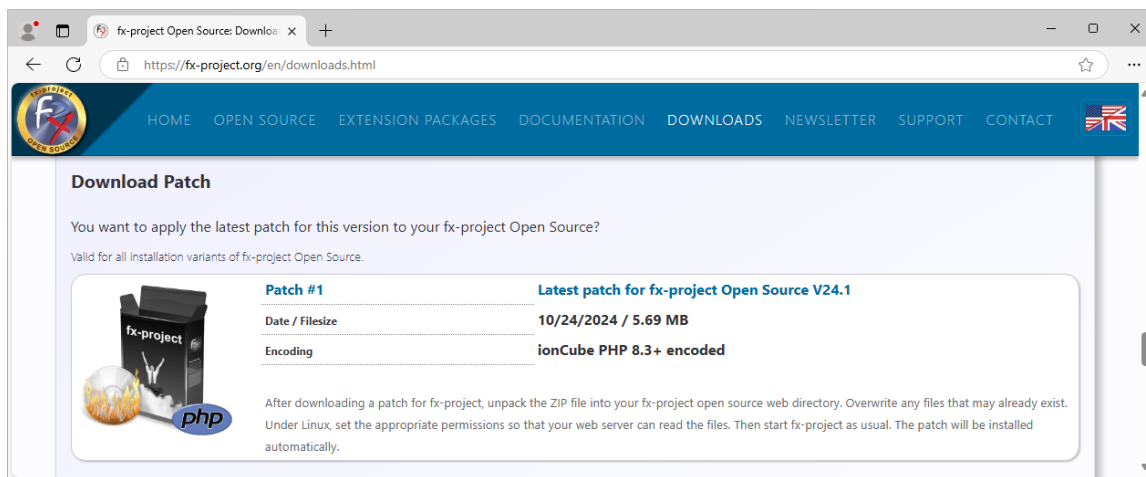

➔ When unpacking, overwrite any files that may already exist.

(Illustration 4: The screenshot may differ depending on the version)

Now check if there are already adapted program parts (**Patch**) for this version. If yes, download the patch and unpack it into your fx-project Open Source directory (here e.g.: </act/web/fxp>).

➔ Overwrite any files that may already exist when unpacking.

(Illustration 5: The screenshot may differ depending on the version)

2.2.3 Copy data

Change to the previously created backup directory (here e.g.: `/act/web/fxp-21.2`) and copy the following files from this directory to the new fx-project Open Source directory (here e.g.: `/act/web/fxp`). Use the appropriate subfolders if specified.

- ✓ Copy the fx-project Open Source initialization file, e.g. `/act/web/fxp/fx_project.ini`
- ✓ In the main folder `/act/web/fxp/DAT` you will find the client subfolders, which contain all data of a client (like person images, print settings, etc.). Copy all client subfolders recursively (i.e. with any subfolders) starting from "1" (e.g. subfolder "1" or "6" for data from client 1 or client 6 respectively).

If you have changed settings in the global client subfolder "0", you should also make these changes in the client subfolder "0" of the new fx-project Open Source directory.

- ✓ The main folder `/act/web/fxp/KEY` contains all your purchased keys for the fx-project Open Source extension packages. Copy all the key files (format: `fxkey-{key number}.fpi`).
- ✓ The main folder `/act/web/fxp/LNG` contains text files for supported languages, e.g. menu or holiday files. If you have made changes yourself, you should also make or transfer them to the files in the new fx-project Open Source folder.
- ✓ The main folder `/act/web/fxp/LOG` contains log entries (e.g. who logged into fx-project Open Source and when, etc.). If you want to keep these, you should copy the contents as well. You should not copy the standard PHP file "index.php".

2.2.4 Assign rights

Make sure that the appropriate rights (read and write rights) are assigned to the new fx-project Open Source directory created (here: **fxp**).

Linux / Apache

You can find out the Apache user and group in the "[httpd.conf](#)" under the entries "**user**" and "**group**". By default, for example, "[wwwrun](#)" and "[www](#)".

You assign the read or write permissions to the fx-project Open Source directory, for example, as follows:

- **chown** -R [wwwrun:www](#) [/act/web/fxp/](#)
- **chmod** -R 775 [/act/web/fxp/](#)

Windows / IIS

Make sure that the web server process account (for IIS, the user [IUSR_\[host name\]](#) or [IWAM_\[host name\]](#)) has read or write access.

- Properties of the directory
- Click security settings
- Add: Restrict the "Search in" selection field to *[computer name]* and add the users with a double-click.
- Confirm with "OK" and set the rights.

2.2.5 Start server

- If you have stopped the server it must now be restarted, e.g. under Linux as root with:

service [apache2](#) start

or e.g. under Windows by clicking on the Apache icon:

2.2.6 Preparations completed

This completes all preparations and you can now perform the actual update.

See for this: [Point 2.5 - Execute update](#)

2.3 Update to a new VMware version

2.3.1 Preparations

- Make sure that no user is working with fx-project Open Source anymore.
- Perform the following actions as the "root" user, since only this user has the corresponding rights. The default password is: "**fxproject**". To do this, open e.g. a terminal and change the current user with:

su - root

- If possible, stop the web server, e.g. with:

service apache2 stop

- Downsize and backup your current PostgreSQL database, e.g. using

```
reindexdb -U postgres -F -q -a  
vacuumdb -U postgres -z -a  
pg_dump -U postgres -F c -x -f /act/_backups/fxp.dmp fxp
```

with: **postgres** = database superuser
 /act/_backups/fxp.dmp = backup file
 fxp = current fx-project database

2.3.2 Back up data

Save the following data e.g. on a USB stick. This data will be copied to the new VMware version later.

Database

- ✓ Copy the previously created database backup, e.g. [/act/_backups/fxp.dmp](#)

DMS

- ✓ Copy the content of the **DMS folder**, e.g. [/act/dms/](#) (the exact location can be found e.g. in the administrator settings in client 1) into a subfolder "**dms**".

fx-project

- ✓ Copy the fx-project Open Source initialization file, e.g. [/act/web/fxp/fx_project.ini](#)
- ✓ In the main folder [/act/web/fxp/DAT](#) you will find the client subfolders, which contain all data of a client (like person images, print settings, etc.). Copy all client subfolders recursively (i.e. with any subfolders) starting from "**1**" (e.g. subfolder "**1**" or "**6**" for data from client **1** or client **6** respectively).

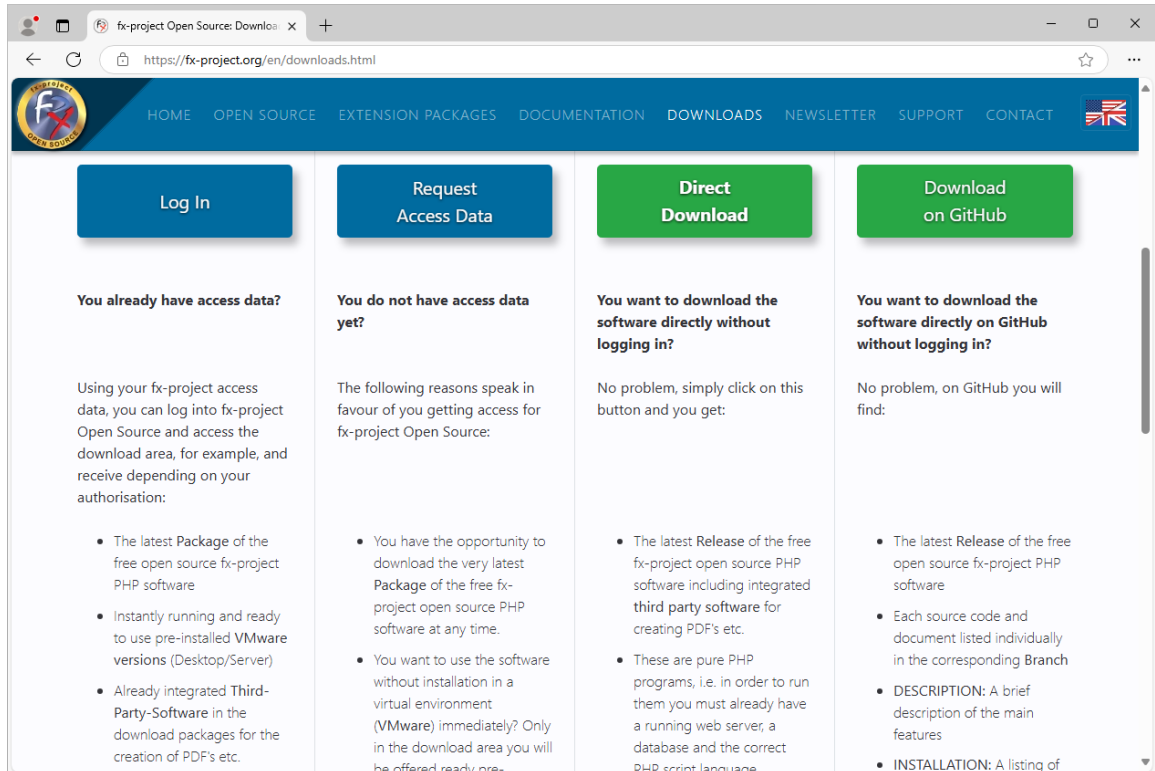

If you have changed settings in the global client subfolder "**0**", you should also make these changes in the client subfolder "**0**" of the new fx-project Open Source directory.

- ✓ The main folder [/act/web/fxp/KEY](#) contains all your purchased keys for the fx-project Open Source extension packages. Copy all the key files (format: **fxkey-{key number}.fpi**).
- ✓ The main folder [/act/web/fxp/LNG](#) contains text files for supported languages, e.g. menu or holiday files. If you have made changes yourself, you should also make or transfer them to the files in the new fx-project Open Source folder.
- ✓ The main folder [/act/web/fxp/LOG](#) contains log entries (e.g. who logged into fx-project Open Source and when, etc.). If you want to keep these, you should copy the contents as well. You should not copy the standard PHP file "index.php".

2.3.3 Download

On our website <https://www.fx-project.org> you can find the latest VMware version of fx-project Open Source including extension packages, documentation and patches in the [Downloads] section.

(Illustration 6: The screenshot may differ depending on the version)

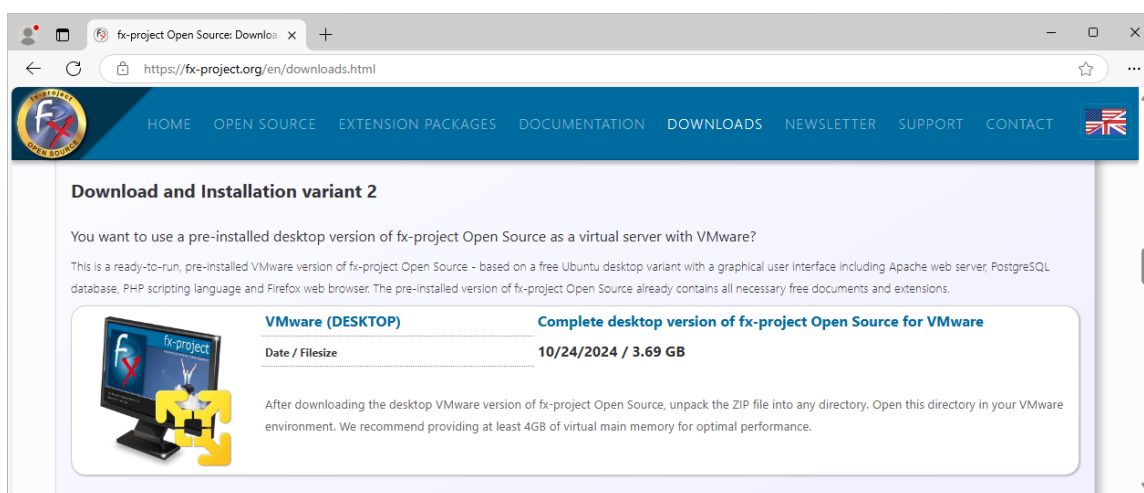

Notice:

To access the download area of fx-project Open Source you need valid access data. If you do not have any access data yet, you can request new access data.

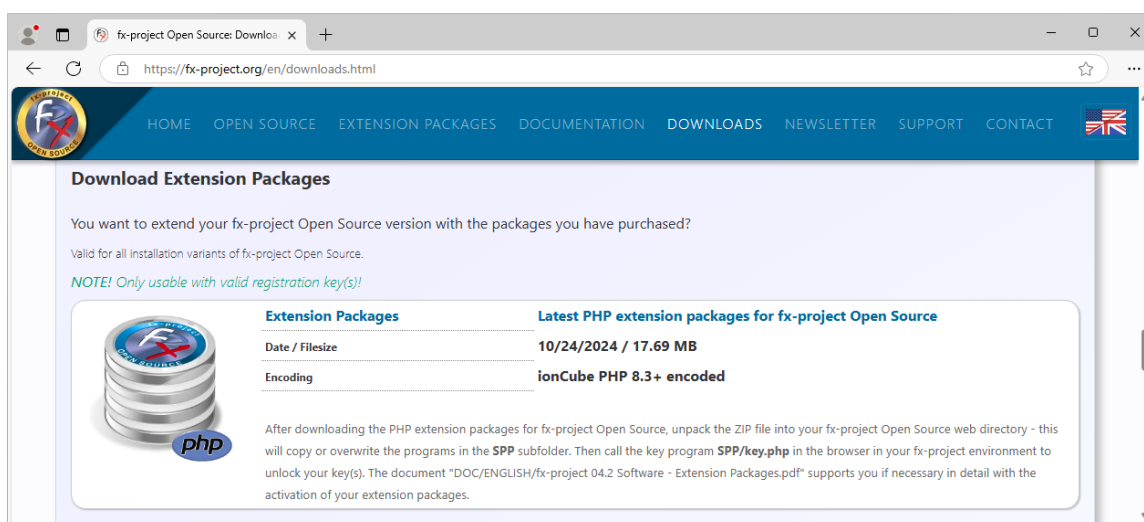

After logging in, you will see a listing of all available downloads.

Download the latest VMware version (**VMware**) either in the DESKTOP or SERVER variant (depending on your preference and/or computer knowledge) and extract the file into your default VMware subfolder of your virtual machines. This will create a subfolder "**fx-project OS V24.1 (VFXPOSD, Ubuntu-24-LTS-DESKTOP)**" (DESKTOP variant) or "**fx-project OS V24.1 (VFXPOSS, Ubuntu-24-LTS-SERVER)**" (SERVER variant) or similar with five files.

(Illustration 7: The screenshot may differ depending on the version)

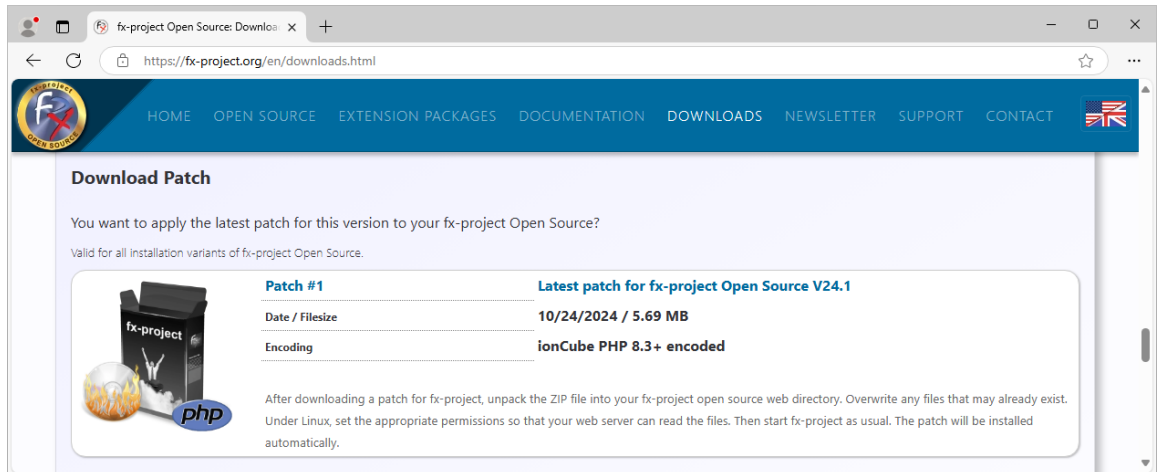

If you have purchased **Extension Packages**, you can download the file and copy the ZIP file to the above USB stick.

(Illustration 8: The screenshot may differ depending on the version)

Now check if there are already adapted program parts (**Patch**) for this version. If so, download the patch and copy the ZIP file to the above USB stick.

(Illustration 9: The screenshot may differ depending on the version)

2.3.4 Launch VMware

Start the VMware and open the previously downloaded and unzipped version of fx-project Open Source.

How to install and/or set up VMware you can read again in this document here:

➤ [fx-project 04.1 VMware - Installation.pdf](#)

2.3.5 Copy data

Now copy the previously backed up data from the USB stick to the virtual Ubuntu fx-project Open Source Server.

Database

- ✓ Copy the database backup "**fxp.dmp**" to **/act/_backups**

DMS

- ✓ Copy the content of the DMS folder "**dms**" to **/act/dms/fxp**

fx-project

- ✓ Copy the initialization file **fx_project.ini** to **/act/web/fxp**
- ✓ If available, copy all key files (format: **fxkey-{key-number}.fpi**) to **/act/web/fxp/KEY**
- ✓ Copy all client subfolders recursively (i.e. with any subfolders) to **/act/web/fxp/DAT**
- ✓ If you have changed settings in the global client subfolder "**0**", you should also make these changes in the client subfolder "**0**" of the new fx-project Open Source directory.
- ✓ If you have changed texts in the language folder "**LNG**", you should also make these changes in the language folder **/act/web/fxp/LNG** of the new fx-project Open Source directory.
- ✓ If present, copy the contents of the "**LOG**" subfolder to **/act/web/fxp/LOG**

Extension packages

- ✓ If downloaded, copy the ZIP file of the extension packages into the fx-project Open Source main folder `/act/web/fxp` and unpack it. Overwrite all existing files. The ZIP file can now optionally be deleted.

Patch

- ✓ If downloaded, copy the ZIP file of the patch into the fx-project Open Source main folder `/act/web/fxp` and unpack it. Overwrite all existing files. The ZIP file can now optionally be deleted.

2.3.6 Assign rights

Assign the read or write permissions so that the Apache web server with PHP can access the newly copied data:

- **chown** -R wwwrun:www `/act/web/fxp/`
- **chmod** -R 775 `/act/web/fxp/`
- **chown** -R wwwrun:www `/act/dmsfxp/`
- **chmod** -R 775 `/act/dms/fxp/`

2.3.7 Import database

By default, a new VMware version of fx-project Open Source is delivered without a pre-installed database, as this is automatically created during an initial installation.

However, in order for your data to continue to be used and for an update to the new version to be performed, you must create an empty database yourself with the same name as before and then import the data from the backup (= Restore):

- **createdb** -U postgres -E UTF8 -l de_DE.UTF-8 -T template0 -W -e **fxp**

Notice:

The locale must be installed on your system, e.g. here de_DE.UTF-8 for Germany, or en_US.UTF-8 for USA, or en_GB.UTF-8 for Great Britain. Type the command "locale" to get a listing of your installed locales.

*The name of the database to be created (here: **fxp**) must match the old database name if you want to continue using the keys for extension packages - otherwise the keys lose their validity.*

Enter the password that you also specified in fx_project.ini as the password.

Alternatively, you can also adjust the password in fx_project.ini to the password assigned here.

- **pg_restore** -U postgres -d **fxp** /act/_backups/fxp.dmp

2.3.8 Preparations completed

This completes all preparations and you can now perform the actual update.

See for this: **Point 2.5 - Execute update**

2.4 Migration between two VMware versions

2.4.1 Source VMware: Preparations

- Make sure that no user is working with fx-project Open Source anymore.
- Perform the following actions as the "root" user, since only this user has the corresponding rights. The default password is: "**fxproject**". To do this, open e.g. a terminal and change the current user with:

```
su - root
```

- If possible, stop the web server, e.g. with:

```
service apache2 stop
```

- Create backup directory

```
cd /act/web  
mkdir backup
```

2.4.2 Source VMware: Back up data

- Shrink and backup database

```
reindexdb -U postgres -q -a  
vacuumdb -U postgres -z -a  
pg_dump -U postgres -F c -x -f /act/web/backup/fxp.dmp fxp
```

- Backup DMS

```
\cp -Rf /act/dms /act/web/backup
```

- fx-project Open Source backup

```
\cp -Rf /act/web/fxp /act/web/backup
```

2.4.3 Download

On our website <https://www.fx-project.org> you can find the latest VMware version of fx-project Open Source including extension packages, documentation and patches in the [Downloads] section.

Log In	Request Access Data	Direct Download	Download on GitHub
You already have access data?	You do not have access data yet?	You want to download the software directly without logging in?	You want to download the software directly on GitHub without logging in?
Using your fx-project access data, you can log into fx-project Open Source and access the download area, for example, and receive depending on your authorisation:	The following reasons speak in favour of you getting access for fx-project Open Source:	No problem, simply click on this button and you get:	No problem, on GitHub you will find:
<ul style="list-style-type: none">• The latest Package of the free open source fx-project PHP software• Instantly running and ready to use pre-installed VMware versions (Desktop/Server)• Already integrated Third-Party-Software in the download packages for the creation of PDF's etc.	<ul style="list-style-type: none">• You have the opportunity to download the very latest Package of the free fx-project open source PHP software at any time.• You want to use the software without installation in a virtual environment (VMware) immediately? Only in the download area you will be offered ready pre-	<ul style="list-style-type: none">• The latest Release of the free fx-project open source PHP software including integrated third party software for creating PDF's etc.• These are pure PHP programs, i.e. in order to run them you must already have a running web server, a database and the correct PHP script language.	<ul style="list-style-type: none">• The latest Release of the free open source fx-project PHP software• Each source code and document listed individually in the corresponding Branch• DESCRIPTION: A brief description of the main features• INSTALLATION: A listing of

(Illustration 10: The screenshot may differ depending on the version)

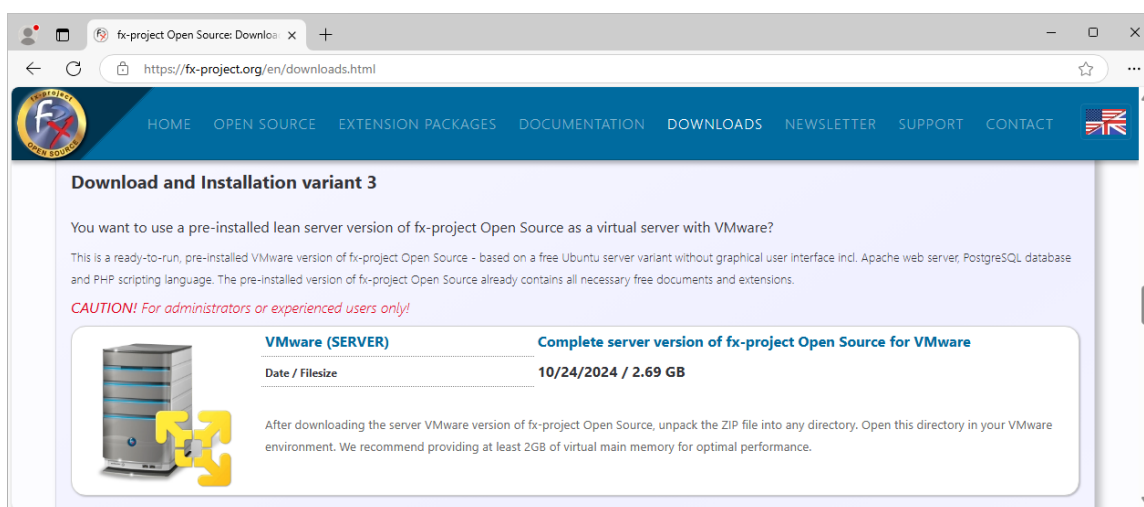

Notice:

To access the download area of fx-project Open Source you need valid access data. If you do not have any access data yet, you can request new access data.

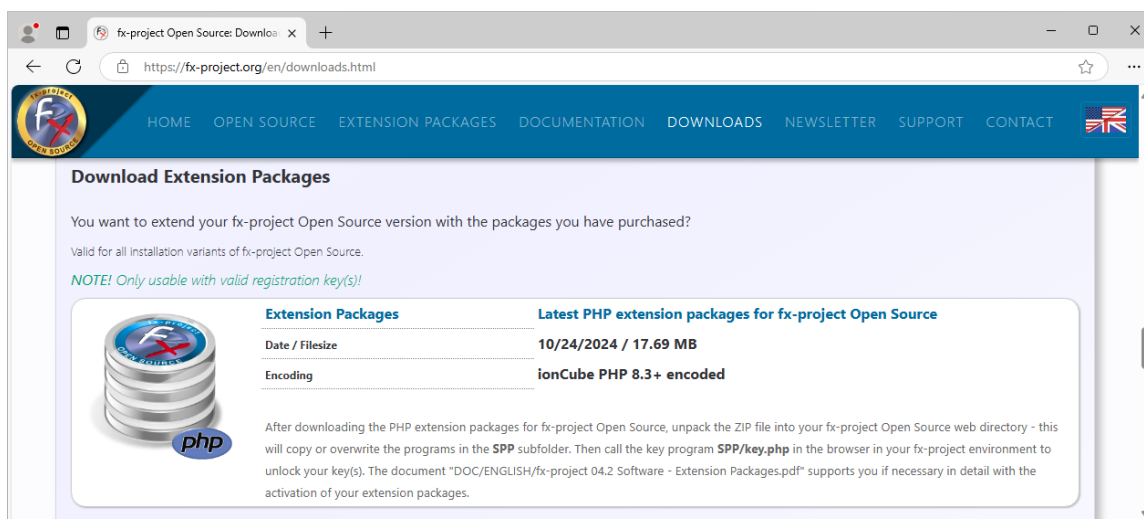

After logging in, you will see a listing of all available downloads.

Download the latest VMware version (**VMware**) either in the DESKTOP or SERVER variant (depending on your preference and/or computer knowledge) and extract the file into your default VMware subfolder of your virtual machines. This will create a subfolder "**fx-project OS V24.1 (VFXPOSD, Ubuntu-24-LTS-DESKTOP)**" (DESKTOP variant) or "**fx-project OS V24.1 (VFXPOSS, Ubuntu-24-LTS-SERVER)**" (SERVER variant) or similar with five files.

(Illustration 11: The screenshot may differ depending on the version)

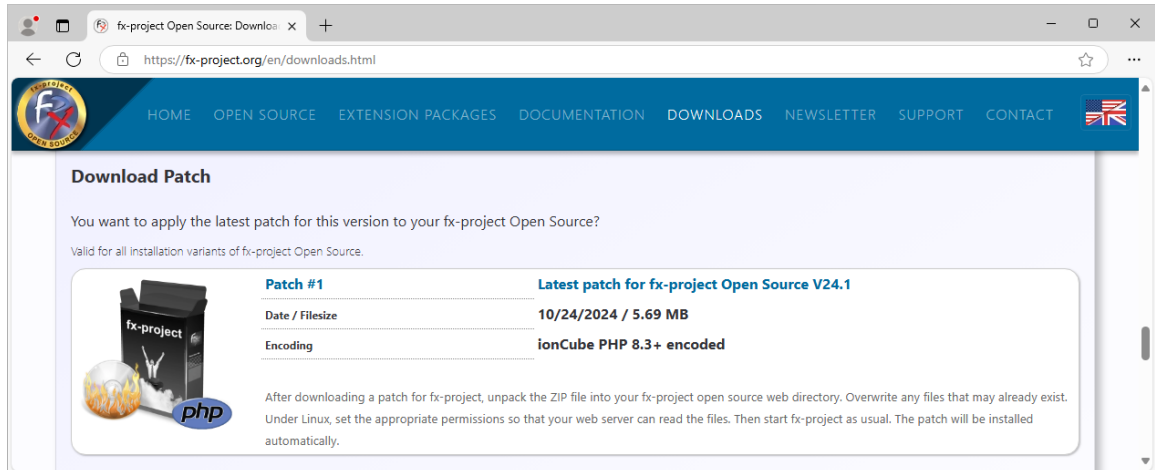

If you have purchased **Extension Packages**, you can download the file and copy the ZIP file to `/act/web/backup` of the source VMware.

(Illustration 12: The screenshot may differ depending on the version)

Now check if there are already customized program parts (**Patch**) for this version. If so, download the patch and copy the ZIP file to `/act/web/backup` of the source VMware.

(Illustration 13: The screenshot may differ depending on the version)

2.4.4 Source VMware: Compress data

- Compress/Zip backup folder

```
tar zcf /act/web/backup.tar.gz /act/web/backup
```

- Assign rights

```
chown -R wwwrun:www /act/web
chmod -R 755 /act/web
```

If possible, start the web server, e.g. with:

```
service apache2 start
```

- Determine IP address of this source computer for later download from the target computer, displayed as **inet** (here e.g. *192.168.0.1*)

```
ifconfig
```

2.4.5 Start target VMware

Start the target VMware and open the previously downloaded and unzipped version of fx-project Open Source.

How to install and/or set up VMware you can read again in this document here:

- [fx-project 04.1 VMware - Installation.pdf](#)

2.4.6 Target VMware: Restore data

- Perform the following actions as the "root" user, since only this user has the corresponding rights. The default password is: "**fxproject**". To do this, open e.g. a terminal and change the current user with:

```
su - root
```

- If possible, stop the web server, e.g. with:

```
service apache2 stop
```

- Get backup from source computer (see IP under point 2.4.4) and unpack it

```
cd /  
wget http://192.168.0.1/backup.tar.gz  
tar xzf backup.tar.gz
```

- Restore DMS

```
\cp -Rf /act/web/backup/dms/* /act/dms
```

- fx-project Open Source Restore client folder (*here e.g. folder "1" - repeat for all client folders*)

```
\cp -Rf /act/web/backup/fxp/DAT/1 /act/web/fxp/DAT
```

- fx-project Open Source key restore

```
\cp -Rf /act/web/backup/fxp/KEY/fxkey* /act/web/fxp/KEY
```

- `fx_project.ini`, log and user sessions restore

```
lcp -f /act/web/backup/fxp/fx_project.ini /act/web/fxp
```

- **lcp** -Rf /act/web/backup/fxp/LOG/* /act/web/fxp/LOG

```
lcp -Rf /act/web/backup/fxp/DAT/USR/C* /act/web/fxp/DAT/USR
```

```
lcp -Rf /act/web/backup/fxp/DAT/USR/L* /act/web/fxp/DAT/USR
```

- If available, extension packages, unpack and delete ZIP file

```
lcp -Rf /act/web/backup/fxpos_024001000_PCK_* /act/web/fxp
```

- **tar** xzf /act/web/fxp/fxpos_024001000_PCK_*

(Overwrite all files: A=All)

```
rm -f /act/web/fxp/fxpos_024001000_PCK_*
```

- If available, add patch, unpack and delete ZIP file

```
lcp -Rf /act/web/backup/fxpos_024001000_PAT_* /act/web/fxp
```

```
tar xzf /act/web/fxp/fxpos_024001000_PAT_*
```

(overwrite all files: A=All)

```
rm -f /act/web/fxp/fxpos_024001000_PAT_*
```

- Assign rights

```
chown -R wwwrun:www /act/web
```

```
chmod -R 755 /act/web
```

```
chown -R wwwrun:www /act/dms/fxp
```

```
chmod -R 755 /act/dms/fxp
```

- Create, restore and shrink database

```
createdb -U postgres -E UTF8 -l de_DE.UTF-8 -T template0 -W -e fxp
```

Notice:

*The locale must be installed on your system, e.g. here **de_DE.UTF-8** for Germany, or **en_US.UTF-8** for USA, or **en_GB.UTF-8** for Great Britain. Type the command "locale" to get a listing of your installed locales.*

*The name of the database to be created (here: **fxp**) must match the old database name if you want to continue using the keys for extension packages - otherwise the keys lose their validity.*

*Enter the password that you also specified in **fx_project.ini** as the password.*

*Alternatively, you can also adjust the password in **fx_project.ini** to the password assigned here.*

```
pg_restore -U postgres -d fxp /act/web/backup/fxp.dmp
```

```
reindexdb -U postgres -q -a
```

```
vacuumdb -U postgres -z -a
```

- Optional: Delete backup files of the previous version

```
rm -Rf /act/web/backup*
```

```
rm -f /backup.tar.gz
```

- If possible, start the web server, e.g. with:

```
service apache2 start
```

2.4.7 Preparations completed

This completes all preparations and you can now perform the actual update.

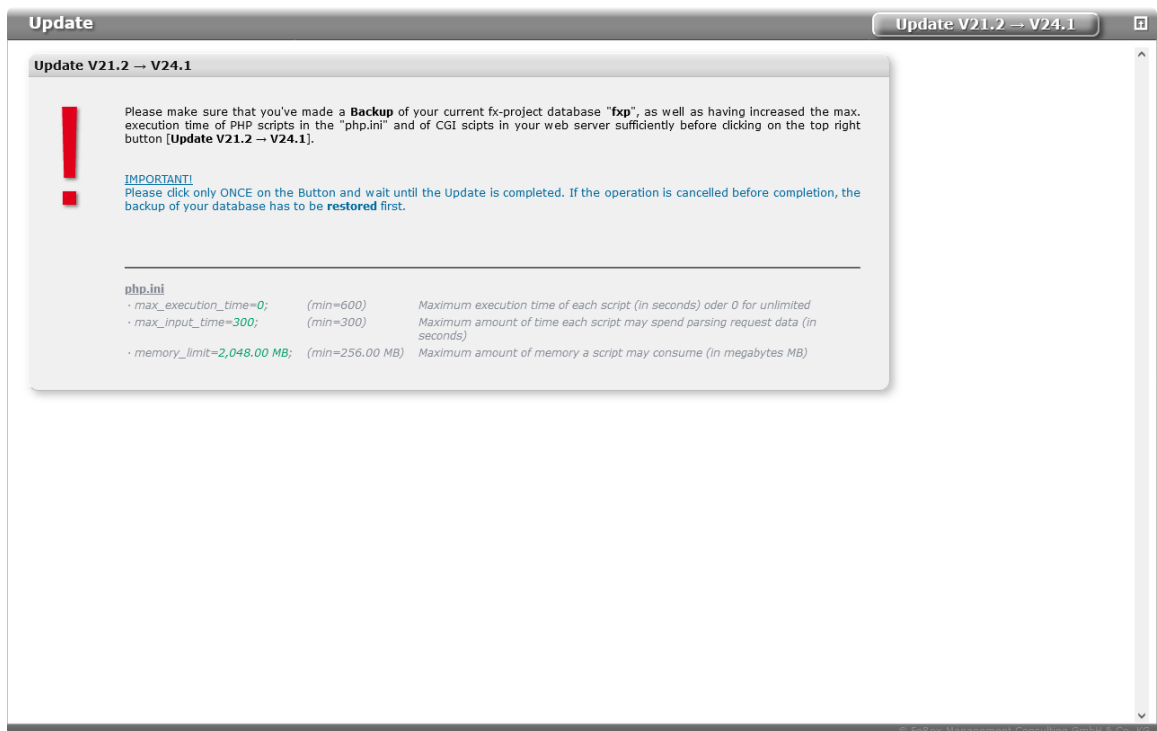

See for this: **Point 2.5 - Execute update**

2.5 Execute update

To do this, start fx-project Open Source as usual in your web browser by entering the correct URL, e.g. "<http://localhost/index.php>", or the new target VMware, e.g. "<http://192.168.0.2/index.php>"

The update screen appears and shows you a version update hint from the "old" to the "new" version number.

(Illustration 14: The screenshot may differ depending on the version)

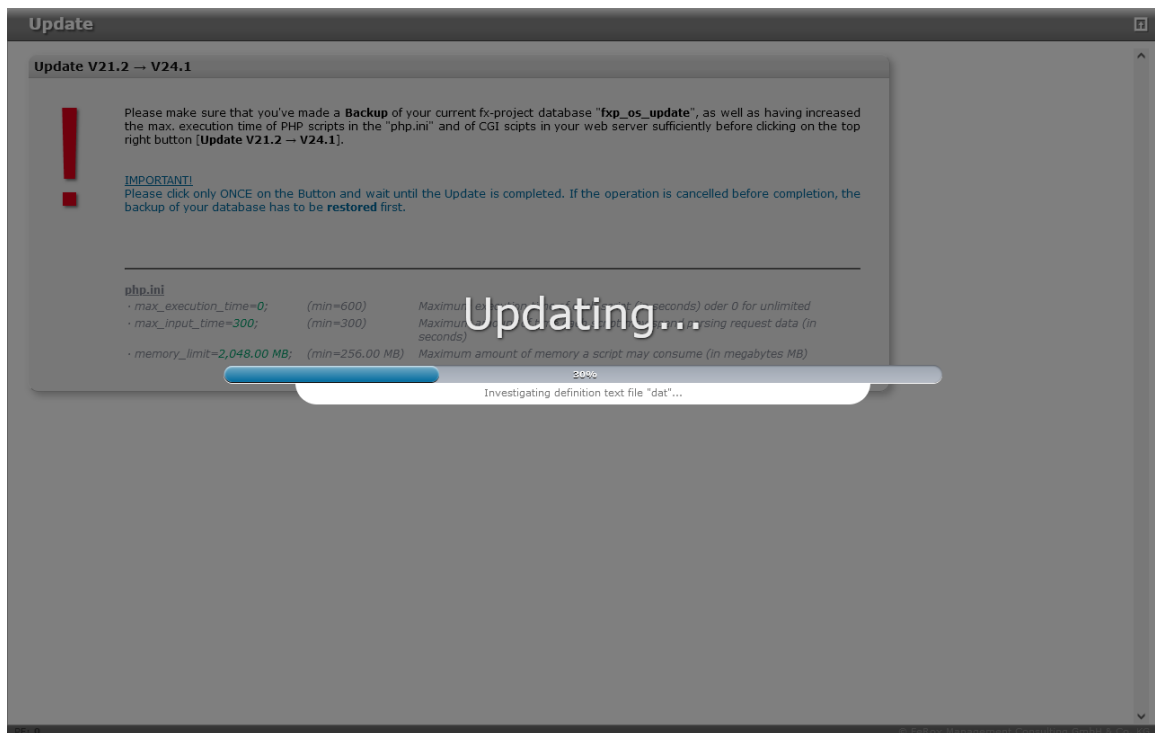

Follow the instructions on the screen. After all points have been observed, click **Update** in the upper right corner to start.

The update can take several minutes depending on the system. (*Usually about 1-5 minutes*).

During the update you can follow the progress by the bar.

The update compares the current actual state of your version with the target state of the new version and makes all necessary changes.

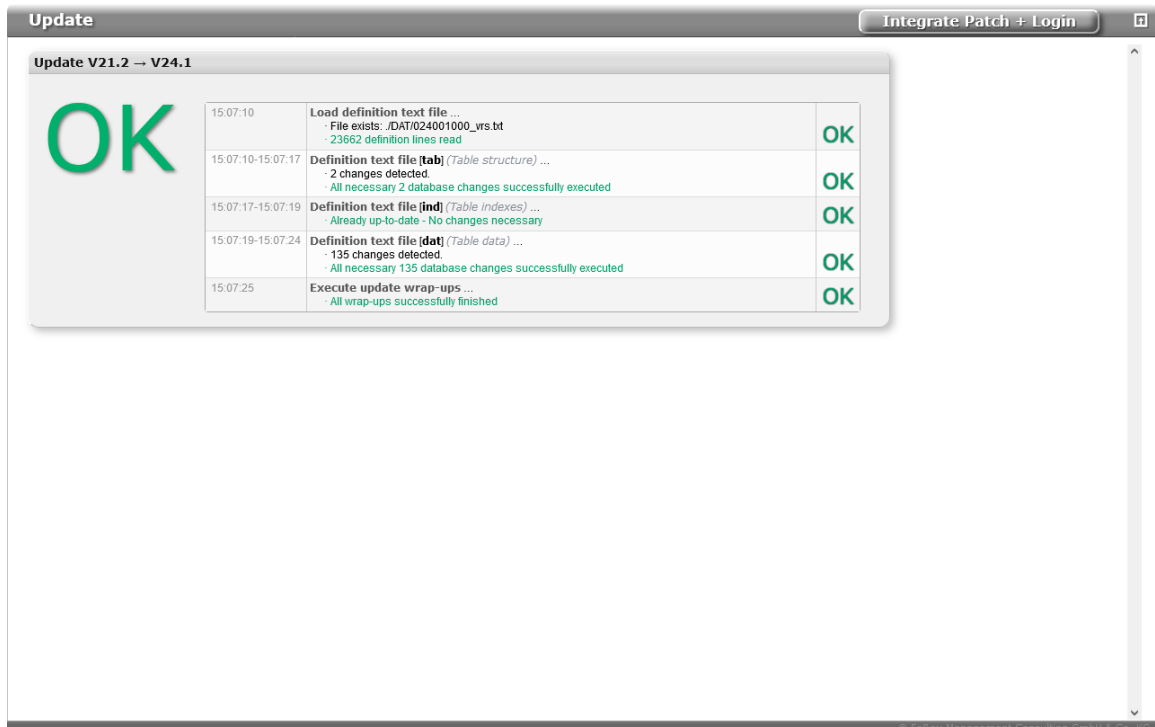

(Illustration 15: The screenshot may differ depending on the version)

If, contrary to expectations, problems occur, please send us in case of error:

- the detailed update log file in the "**LOG**" subfolder of fx-project Open Source (e.g. **upd_021002000-024001000_20240425150709.log**)

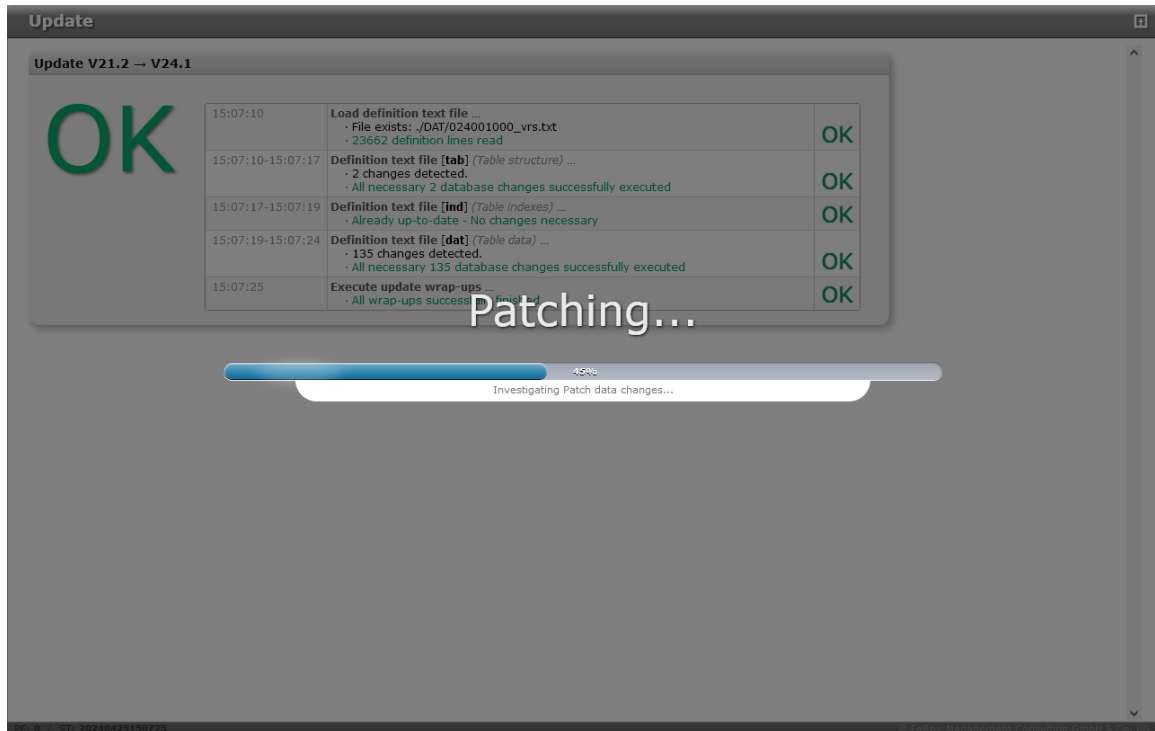

(Illustration 16: The screenshot may differ depending on the version)

After successful installation, the **Login** button will appear in the upper right corner. If you click on it, the usual fx-project Open Source login page will be displayed.

Optional: If there is a patch to apply, the following button appears instead **Integrate Patch + Login**. When you click on it, the patch will be applied.

Optional: If there is a patch to be applied, it will now be integrated, i.e. the necessary database changes will be made.

(Illustration 17: The screenshot may differ depending on the version)

After successfully applying the patch, the usual fx-project Open Source login page is displayed.

2.5.1 Login

A screenshot of a web browser window titled 'Login'. The window has a white background and a grey border. In the center, there is a 'User login' dialog box. The dialog box has a title bar and three input fields: 'Client No.' with the value '1', 'User Name' with the value 'admin', and 'Password' with the value 'fxproject'. Below the input fields is a 'Login' button. At the bottom of the dialog box, it says 'Powered by FeRox'. The browser window has a scrollbar on the right side.

2.6 Customize DMS directory

If the DMS directory of your previous fx-project Open Source installation differs from the path of the new installation, e.g. the new Ubuntu VMware version (here e.g. **/act/dms/fxp/**) you have to correct this by logging in as administrator in client 1 and using the program function

Administration ► Client ► Client Settings

change the setting value for **"DMS: Path to document archive"** to **/act/dms/fxp/**.

(Illustration 19: The screenshot may differ depending on the version)

Notice:

The default backups for the DMS as a cronjob back up the contents of the **/act/dms/fxp/** path.

If you want to keep your old DMS path, you have to manually coordinate fx-project Open Source with your path and modify the cronjob accordingly.

The DMS-cronjob file is located in **/act/_cronjobs/dms_backup**.
